Overview🧭

GanzSe Jewelry - Fantasy Low Poly Pack is a stylized low-poly accessory pack designed for fantasy characters, RPG heroes, nobles, mages, merchants, adventurers, NPCs, and modular character customization.

This pack includes **10 matching jewelry sets**, each designed around a distinct fantasy theme and visual identity. Every set contains a complete amulet, a separate chain-only version, a separate pendant-only version, two ring shapes, and an earring accessory.

Each jewelry piece comes with **3 color variations**, giving you a total of **180 individual accessory models** for building varied character outfits, faction styles, magical equipment sets, noble costumes, or fantasy NPC designs.

The ring accessories include both **round and square variants** with the same visual design, allowing for easier fitting across different hand shapes and character proportions.

All models are created with clean low-poly geometry, readable silhouettes, and a consistent stylized fantasy direction. The pack is designed to integrate easily into modular character systems, character equipment setups, NPC customization, and stylized RPG projects.

The jewelry accessories are optimized for mobile and stylized projects, with separate meshes that can be attached to character rigs and adjusted for different body proportions, finger shapes, ears, neck positions, and outfit types.

⭐If this kit helped your project – please leave a review on the Asset Store!
Your feedback supports future updates and helps fellow devs know what to expect.

Thanks for creating with GanzSe!

Technical Appendix🧰

Jewelry Attachment Guide

To properly attach the jewelry accessories to a character model:

1. Locate the required character bones

Depending on the accessory type, locate the appropriate bones in the character rig:

- **Head** or ear bones for earrings
- **Neck**, **UpperChest**, or **Chest** for necklaces and pendants
- Individual finger bones for rings

Common humanoid rigs may use names such as Head, Neck, Spine2, UpperChest, LeftHandIndex1, RightHandRing1, or similar names depending on the rig.

2. Create accessory mount points

Create empty GameObjects under the appropriate bones to use as positioning mounts.

Examples:

- Left_Earring_Mount
- Right_Earring_Mount
- Necklace_Mount
- Pendant_Mount
- Left_Ring_Mount
- Right_Ring_Mount

These mount points make it easier to adjust accessory placement without changing the original character mesh or rig.

3. Attach earrings

For characters with dedicated ear bones, attach the earring accessory directly under the corresponding ear bone.

For characters without ear bones:

1. Create Left_Earring_Mount and Right_Earring_Mount as child objects of the **Head** bone.

2. Move each mount point to the appropriate ear position.
3. Attach the earring model as a child object of the correct mount point.
4. Adjust local position, rotation, and scale until the accessory fits the ear and hairstyle.

4. Attach necklaces, chains, and pendants

Create a Necklace_Mount or Pendant_Mount as a child object of the **Neck**, **UpperChest**, or **Chest** bone.

Position the mount point in front of the character's neck or upper chest, depending on the outfit and accessory type.

- Use the complete amulet model for a full necklace setup.
- Use the chain-only model when combining it with other pendants or character equipment.
- Use the pendant-only model for custom necklace setups, magical items, or alternative chain designs.

Adjust the local position, rotation, and scale so the jewelry rests naturally over the character's clothing or armor.

5. Attach rings

Create a separate empty GameObject under the finger bone where the ring should be placed.

Examples:

- Left_Index_Ring_Mount
- Right_RingFinger_Ring_Mount
- Left_Thumb_Ring_Mount

Attach the ring model as a child object of the selected finger mount point, then adjust its local position, rotation, and scale.

The pack includes both **round and square ring variants** with matching designs. Choose the version that fits the character's finger shape and hand style more naturally.

For characters with multiple wearable rings, create separate mount points for each finger.

6. Save reusable setups

Once the jewelry placement is correct, save the character configuration as a **Prefab Variant**. This allows the same jewelry setup to be reused across different characters, outfits, or color variations.

All jewelry meshes are separate accessory objects, making them easy to parent to a character rig without modifying the original character mesh or skeleton.

💡 **Tip:** Preview rings, earrings, necklaces, and pendants with idle, walk, run, combat, and head-turn animations before final prefab placement. Check for clipping with hands, hair, clothing,

armor, capes, or other accessories.
